When you have different applications in your application stack, it would be a little annoying to switch between the applications

This is where,URL alias comes into picture.

1. This is being introduced in version 8.4.

2. When we create an application, pega creates an application url always automatically

3. It is found in application definition

Let us say that we want to switch to different application, you can just open a new tab and copy the application URL alias and paste. You will have 2 different tabs with different applications.
